HOSPITAL EMERGENCY ROOM

KEY TAKEAWAYS

Descriptive Analysis

(April 2023 – October 2024)

The emergency room dataset spans 19 months and includes records of **9,216 unique patients**.

Patient Wait Time & Satisfaction

The **average waiting time** in the ER was around **35.3 minutes**, showing there is still room to streamline processes and improve patient flow. The **average satisfaction score** was **4.99 out of 10**, indicating a moderate level of satisfaction and highlighting opportunities to enhance the overall patient experience.

Departmental Referrals

A large proportion of patients (**5400**) did not require referrals. Among those who did, the most frequent referrals were to **General Practice (1840 cases)** and **Orthopedics (995 cases)**, followed by **Physiotherapy (276 cases)** and **Cardiology (248 cases)**.

Peak Busy Periods

The busiest days in the ER were **Mondays (1377 patients)**, **Saturdays (1322 patients)**, and **Tuesdays (1318 patients)**. The highest traffic hours were **11 AM**, **1 PM**, **7 PM**, and **11 PM**, suggesting the need for adequate staffing during these times.

Patient Demographics

Adults aged **30 - 39 years** formed the largest patient group (**1200 patients**), followed by **young adults aged 20 - 29 years (1188 patients)**. A considerable number of patients also belonged to the **40 - 50 years** age group.

Race Distribution

The majority of patients identified as **White (2571)**, followed by **African American (1951)**, **Multiracial (1557)**, and **Asian (1060)**. Around **1030 patients** chose not to disclose their race.

Admission Patterns

Almost half of the patients (**4612**) were **admitted**, while the remaining (**4604**) were **treated and discharged**.

Summary

Overall, the dataset highlights consistently high patient volumes, moderate satisfaction levels, and frequent referrals to General Practice and Orthopedics. Mondays and late-night to early-morning hours appear particularly busy. The patient base represents a wide range of age and racial groups, with nearly equal numbers of admitted and non-admitted patients. These insights can support better resource planning, staffing decisions, and strategies to improve patient care in the emergency room.
